1 EXTRACTING OCR

The extraction of the PDF-Files consists of the following steps:

1. First, the information is extracted (`Improved_Extraction_June_2.R`).
2. Second, additional code checks for potential mistakes during extraction (`audit.R`).

2 WEBSCRAPING

The Webscraping consists of three different steps:

1. First, the data is extracted sequentially (`sequential_scraper.R`).
2. Second, the data is re-arranged so that it fits the format (`layout.R`).
3. Then, the herred files are merged, so that there is one file per amt (`combine_by_amt.R`).
For example, Herred *Aure* belongs to Amt *Møre og Romsdal*.
4. In order to ensure that all documents have the same structure, the files from 1886 and 1838 are formatted accordingly (`formatting.R`). Additional information in other columns are kept in the document.

3 CALCULATION OF LAND OWNED BY WOMEN

If there are multiple owners with different genders, the `skyld/mark/ore` column are split accordingly, with every other information remaining the same. This is shown in Table 3.1, where

Panel A is the original row. Panel B splits the original row by names and the DEC_SKILL column is divided by three. Note: The code is different for documents that were downloaded (Gender_Downloaded.R), web-scraped (Web-Scraped.R), or which ran through the OCR (Gender.R) process because the format is different.

Table 3.1: Splitting multi-owner properties into one row per owner

EIER1	EIER2	EIER3	DEC_SKILL	Gaard	Brug
<i>Panel A: original record</i>					
Hannah	Peter	Peter	30	Brugg	Handel
<i>Panel B: after splitting</i>					
Hannah			10	Brugg	Handel
	Peter		10	Brugg	Handel
		Peter	10	Brugg	Handel
